Originally known as the Smith & Wesson 38 Hand Ejector before being renamed the Model 10 after the Second World War, this revolver was manufactured in excess of 6 million units, making it the most produced handgun of the 20th century. Issued in large numbers to the U.S. troops during the Great War, the pistol proved reliable and effective. In fact, the revolver remained in U.S. service as late as the 1990s before officially being phased out for the Beretta M9. The revolver remains in use with civilians and various law enforcement agencies.

Manufactured by both Smith & Wesson and Colt under the name M1917, the revolver was designed to address the shortage of M1911 pistols for U.S. troops. At the outbreak of American involvement in the Great War, the Doughboy American Expeditionary Force would deploy with the M1917 in mass. Seeing widespread combat success, the revolver would be adopted by the British and continued to see combat with the U.S. Army as late as the Vietnam War for tunnel clearing duties. Law enforcement and members of the public also became interested in the revolver making it a desirable collectable today.

Known simply as the 1911, this pistol was born out of a desire by U.S. weapons procurement to translate the self loading mechanisms from machine guns and rifles into a pistol package. While unsatisfied with the mechanical complexities of the Lugar and similar existing platforms in 1899, the U.S. ordered the development of a new firearm which Colt ultimately won against Savage Arms with the Browning designed M1911. While deployed in more limited numbers during the first World War, the M1911 would become the sidearm of choice from World War II all the way up until the Gulf War where while being officially replaced in 1985, it didn't see a practical phase out until the 1990s by the Beretta M9. Despite this, many special forces, law enforcement, and civilians still trust the classic design.

Named for its hammer being concealed for ease of drawing without snagging, the M1903 was produced from 1903 up until 1945 with over half a million units seeing combat primarily with the U.S. and UK during both World Wars. Not to be confused with the FN Model 1903 or Colt Model 1908, which are both based off the M1903 but chambered for different rounds, the M1903 filled a need for a compact combat pistol where a full sized sidearm was not needed. Covert operatives, commandos, and intelligence agents favored the M1903 for its light weight and concealability. It wasn't until the 1970s that the M1903 was phased out for more modern and compact versions of the M1911.

The Webley Top-Break Revolver, introduced in 1889, is an iconic British service revolver used as late as 1947. First deployed during the Second Boer War by the British against former Dutch South Africans, the revolver would go on to serve in the First and Second World Wars. Not to be confused with the Webley Mk IV Pocket Revolver which is 38 caliber and remained in service as late as 1970, the Webley Mk VI was renowned as a heavy hitting pistol with its large 455 caliber said to have better stopping power than even the legendary Colt 45 cartridge.

Nagant M1895

A unique design with a unique cartridge that had the projectile recessed within the casing. The Nagant revolver, when fired, pressed the cylinder flush with the barrel and the lip on the cartridge creates a perfect seal maximizing the punch of the expanding gas. Entering service with the Imperial Russian Army in 1895, the Nagant was widely popular and produced in excess of 2 million units. Because of its popularity, the Nagant revolver saw combat all over the world like in the Boxer Rebellion, Russian Revolution, Spanish Civil War, and the Vietnam War.

Known as the Parabellum Pistol and built as the successor of the C93, the first standard semi-auto pistol. The Luger was seen as an improvement to the more complex and less reliable C96. In 1908, Kaiser Wilhelm II would order the pistol into production for the German Army and it would first see combat in Germany's scramble for Africa. More famously, the pistol would become an icon of the German officer during both World Wars. Its unique silhouette and toggle-lock action would make the gun a symbol of Nazi atrocities and a desirable collectors item for both Allied troops during the war and historians nearly a century later.

Nicknamed the “Broomhandle” for its grip’s shape, the Mauser Konstruktion 96 was one of the earliest semi-automatic pistols to be mass produced. Initially finding popularity with British officers, the weapon was praised for its high powered ammunition and internal box magazine. However, the gun suffered from mechanical complexity and while replacements would come to challenge it, the C96 still saw extensive combat as late as World War II and by irregular forces to this day. While becoming a legendary symbol in many cultures for many reasons, you may recognize the C96 as Han Solo’s sidearm of choice.

Beginning in 1903, this rifle served as a U.S. military's standard-issue weapon for both World Wars. Due to its size, precision, and dependability, the M1903 was well liked by the soldiers over the M1917 counterpart. During World War II and through to as late as Vietnam, the M1903 was used by snipers, designated marksmen, and other specialist troops despite the M1 Garand gradually replacing it as the U.S. Armed Forces main rifle. Currently, the M1903 serves as colorguard and training rifles.

When the U.S. entered the Great War, they had to hastily ramp up rifle production to outfit their soldiers. Unfortunately, production of the M1903 and other existing rifles couldn't meet the Army's demands. In a twist of luck, three American firms were already producing the Lee Enfield rifles for the British. It was decided to alter the production line to chamber rifles with the more potent 30-06 round. This became the M1917, the most commonly used firearm by the Americans in World War I. After the war, most of the guns were modified and sold off as surplus where they were well-liked as hunting rifles. Modified M1917s are still in use by Danish naval special forces, Slade Patruljen Sirius, due to their excellent cold-weather reliability.

The first rifle adopted by the U.S. to use smokeless powder, the Krag rifle has a distinctive loading box which loads the new 30 caliber ammunition that replaced the old 45-70 Government. Mainly used by the U.S. Army in the Spanish American War, the rifle did see limited use in World War I however with the rapid advancements in firearm technology, the Krag was quickly replaced by the more traditional bolt action Springfield M1903.

Born from a rushed need for a modern domestic light machine gun after the U.S. entered World War I, the BAR would replace guns like the Chauchat. While impressive for being one of the first practical automatic rifles, ultimately, American doctrine for the BAR limited its design and implementation. Both the French and Americans followed the Prussian inspired Marching Fire or Walking Fire where advancing infantry would suppress the enemy without stopping to aim. The demands of the BAR to be shoulder fired rifle as well as filling the light machine gun role would ultimately haunt the gun as, by the Second World War, the BAR was considered inferior to German general purpose machine guns for its lack of firepower and for being too heavy to be an effective rifle. Nonetheless, the BAR would continue to serve in the Army as late as Vietnam before being phased out by the M14 and M60.

Adopted in 1895 and used by the British army until 1957, the Lee-Enfield is a legendary family of rifles well known for their fast firing ability in the right hands. The British army sponsored contests nicknamed "the mad minute" prior to World War I. Skilled riflemen could shoot 44 times in a minute, reliably striking 12" targets at 300 yards. The troops were so quick that early in the war, the Germans would often believe the British were firing on them with machine guns. Unfortunately, The Great War's vast death toll caused this legendary ability to fade into memory. However, the Lee-Enfield continued its service seeing action again in the Second World War as Britain's primary service rifle.

With the invention of smokeless powder by a French chemist in 1884, the Fusil Lebel became the first standard military firearm to take advantage of the new technology. As other countries scrambled to develop their own modern rifles, the Lebel rifle would be produced in excess of 3 million units, exported all over the world, and remained the primary rifle of the French throughout the Great War. While just prior to the Second World War the French were trying to modernize the MAS-36, the Nazi occupation would delay those efforts further, even issuing the Lebel rifle themselves to Wehrmacht conscripts. The Lebel M1886 not only was historic for being the first modern smokeless rifle, but also left its impact on the battlefield from the Boxer Rebellion to the U.S.-Afghanistan War.

An upgrade of the original 1892 Berthier, the M16 variant was developed in 1916 to replace the Lebel rifle by addressing issues such as the old 3 round magazine and less robust build. Due to its compact design the gun was also known as the Mousqueton Berthier. Mousqueton referred to the metal clips cavalrymen would use to secure their carbines, and later to the short cavalry muskets themselves. While introduced amidst the ongoing war, the M16 Berthier would become the most popular variant seeing extensive combat with France, Greece, and other Baltic states. After the war, the rifle would continue to see service being exported or captured by a variety of powers such as the Nazis and Vietnamese.

Introduced into service with the Italian Army in 1891, the Carcano was the standard infantry rifle for Italy through World War I and even into the Second World War before being replaced by Lee Enfields and M1 Garands after the war. While being a perfectly functional rifle produced in excess of 3 million units, the Carcano has garnered a negative reputation both for its performance as Italy's manufacturing industry struggled during this time, and for being the rifle used to assassinate U.S. president John F Kennedy. The rifle continues to leave its mark on the civilian market and by use with irregular forces.

A refinement of the less popular but still effective bolt action Mauser 1895, the G98 replaced the older Gewehr 1888 and became the standard issue rifle in the German Empire during World War I. Not to be confused with the later Karabiner 98k, which was standard issue in Germany during World War II, the G98 would be produced in excess of 9 million units and stay in service until 1945, only being phased out by more modern bolt action and semi-auto rifles. Irregular forces still use the G98 to this day.

The C96 Carbine, a variant of the Mauser C96, emerged in 1898 with an extended barrel and a stock. The C96 Carbine offered improved accuracy and stability, resembling a compact rifle. Its easy handling and relatively compact size for a long arm made it suitable for cavalry, rear echelon troops, and early aviators to shoot at other scout planes.

One of the most popular and mass produced guns in history at over 37 million units, the Mosin Nagant was officially adopted in Imperial Russia as the 3-line rifle Model 1891 for its bore size being three line or “liniya” defined by Peter the Great as one-tenth an English inch. The most widespread variant M1891/30, would see fighting as early as the Boxer Rebellion and up to modern day, being standard in the USSR issue during both World Wars. After which, the gun would go on to be widely exported throughout the world with users like Iraq, China, and Vietnam. The Mosin lives on seeing active use with irregular forces, civilians, and some militaries, cementing itself as a legendary historical weapon.

An evolution of the pump action Winchester M1897 and initially only available in 20 gauge until 1914, the Model 12 shotgun was a popular trench gun for the United States during the Great War. Additionally, it gained popularity with law enforcement as a riot gun and civilians as a hunting or home defense firearm. This led to just shy of 2 million units being produced as late as the 1960s before cheaper more modern shotguns outcompeted it. While the U.S. was in the process of phasing out the Model 12 during the Vietnam War for the Ithaca, the M12 stuck around until production halted and stockpiles ran out.

While many would gain the nickname, the Model 97 was the Trench Gun. An evolution of the short lived Model 1893 pump action shotgun, the M97 would first see combat in the Philippine-American War. However it wouldn't be till the Great War where it would see extensive use by the American Expeditionary Forces as a devastating close range weapon. In 1918, Imperial Germany would file a formal protest arguing the use of shotguns was a war crime. While the protest was ignored by the Entente, Germany threatened to execute any POW found using the weapon.

Born of a partnership between Browning and FN Herstal, the Auto-5 was named for its novel semi-automatic design and the five shells it carried. When it was introduced in 1898, the Auto-5 became the first mass produced semi-auto shotgun, and remained in production until 1998. First seeing combat in the Great War, the Auto-5 would remain in service as late as the Vietnam War. The gun is still used in some law enforcement and by civilians, however variants go by different names for different manufacturers like the Remington Model 11 and Savage Arms Model 720.

Heft Score	2	
Barrel Length	Standard Pistol Barrel	
Note: - This weapon has a default Horizontal Magazine, +3 To-Hit when Prone		

The MP 18, introduced in the early 20th century, is a groundbreaking submachine gun that holds the distinction of being the world's first practical submachine gun. Designed by Hugo Schmeisser, this submachine gun used an unusual 32 bullet “snail” magazine popular on Luger carbines, which could be loaded with four 8 round Luger clips. The German Empire developed the submachine gun to support fire and maneuver tactics as well as trench clearing during the Great War. While only being delivered in limited numbers before the end of the war, the design was sound and the submachine gun would go on to be used by the SS and police forces in support roles.

Adopted in 1918 by the Italian Army, the Model 1918 was a conversion of the unwieldy dual barrel Villar-Perosa aircraft submachine gun set in a Carcano rifle stock. While designated as a submachine gun, the gun was made to only fire in semi-automatic, however later variants would reintroduce automatic cycling. Seeing combat at nearly the same time as the MP-18, some consider the M1918 the true first submachine gun while others classify it as a carbine. Regardless, the gun was a competent trench clearing tool during the war. Later it received major upgrades like the M1918/30 variant, and continued to serve until being made obsolete by the Beretta Model 38.

Heft Score	8	
Barrel Length	Long Rifle Barrel	
Note: - This weapon has a built in bi-pod		

The Lewis Gun was designed in the United States in 1911, but initially only adopted into service by the United Kingdom in 1915 due to political issues. Possessing a unique pan magazine and air cooler sleeve, the light machine gun had a high volume of fire allowing the British to use it to supplement their Vickers heavy machine guns. While seeing the heaviest fighting during the Great War as an infantry and aircraft weapon, the Lewis Gun was also used in conflicts like the Vietnam War, the Emu War, and World War II before being replaced in British service by the Bren.

With over 250,000 Chauchats manufactured, this light machine gun became the most manufactured automatic weapon of the Great War. While primarily in service with the French Army, the United States also adopted the Chauchat to supplement their lack of a domestic LMG. While innovative for being the first squad automatic weapon, the Chauchat suffered from many issues. Mechanically, its curved magazine often jammed leading troops to load 17 rounds instead of the full 20. Additionally, flawed “marching fire” tactics also contributed to the gun’s poor performance.

Introduced in limited numbers at the end of World War I as a U.S. homegrown replacement for the Hotchkiss, the M1917 became the standard rifle caliber heavy machine gun of the U.S. During the interwar years, the aircooled M1919 was developed from the M1917 and became the more iconic American machine gun of World War II, however there was still a need for a heavy machine gun which could sustain fire, and the water cooled M1917 would continue to see use as late as the Korean War with the United States and abroad as an export gun to this day.

Heft Score	8	
Barrel Length	Long Rifle Barrel	

The primary machine gun for the French Army during World War I, the Hotchkiss 1914 was the predominant variant of a family of Hotchkiss machine guns. While its 30 round stripper belt limited its volume of fire, the Hotchkiss was notable for being one of the first aircooled medium machine guns, reducing its weight significantly compared to its contemporaries. The United States also purchased the gun in 1917 to supplement their Expeditionary Forces. By the end of the war, the Hotchkiss would be rendered obsolete, however it was seeing service as late as the 1960s in Algeria and Vietnam for its reliable design.

Based on the Maxim design after Vickers purchased the Maxim company, the Vickers gun was the mainstay heavy machine for the United Kingdom during both World Wars. Introduced in 1912, the Vickers provided automatic fire for infantry, aircraft, watercraft, and armored vehicles. While an old design, it was well regarded for its robustness and reliability. In British service, the Vickers wouldn't be replaced until the late 1950s by the FN MAG general purpose machine gun and continued to see use in other countries like India as late as the 1970s.

Based on the Maxim gun, the MG 08 heavy machine gun entered service in 1908 and became synonymous with German military power during World War I. Developed by Louis Schmeisser, the MG 08's widespread use in trench warfare and its ability to deliver suppressive fire earned it a prominent role on the battlefield. Variants of the MG 08 were used by German forces on multiple fronts in the thousands. Its mass production became so well renowned that the 1915 variant of the gun, the 08/15 or Nullachtfünfzehn became slang in German for “run of the mill” or ordinary.

The PM M1910, introduced in 1910, is a heavy machine gun that played a significant role in the arsenal of the Russian Empire, Soviet Union, and other countries that used it. It was a mainstay during both World Wars and continues to this day. The PM actually holds the record for the longest serving machine gun, seeing combat in Ukraine as a highly sustainable firing platform. Developed from an early Vickers gun design, the PM can trace its lineage to the original Maxim gun, however unlike other countries which preferred their Maxim derived HMGs on a tripod, the Russians tended to mount the PM on a moveable wheeled carriage.
