In the interwar period, the French government requested bids for a new service pistol. Interested, the Belgian company FN Herstal contracted John Browning for design work, and while the rights for the M1911 were sold to Colt, his new pistol would take heavy inspiration from it. Unfortunately, John Browning would pass away in 1926 before design work finished on the Hi-Power, but his name would remain with the weapon. During World War II, the Hi-Power would serve with both the Allies and Axis. While Germany captured the FN factories when they annexed Belgium, FN engineers were able to smuggle its designs to the UK, allowing for limited Allied production.

Developed in 1927 from the experiences with the snub-nose Fitz Special, and built from a Colt Police Positive Special, the Colt Detective Special was designed to provide officers with a compact, reliable, and easily concealable firearm for undercover and off-duty use. Widely adopted by law enforcement agencies across the United States, it earned a reputation as a dependable backup or concealed carry firearm for officers and civilians alike.

Following the Great War, the UK decided that a smaller caliber sidearm to replace the Webley would be needed to reduce recoil and decrease training time. Beating out the 38 S&W Webley Mk IV, the Enfield revolver was adopted in 1932. While officially the No. 2 revolver would be declared obsolete in favor of semi-auto designed like the Hi-Power at the end of World War II, the revolver would go on to serve in the British Army till as late as 1969, seeing combat in the Korean War, the Troubles, and other mid-century conflicts the UK was involved in.

Entering service with the Nazi's at the outbreak of World War II in 1939, the Walther P38 was intended to be a simpler and cheaper replacement for the Luger P08. While less known than the Luger pistol, the P38 was more widely used by Nazi forces in World War II. After the war, the pistol continued to serve in militaries around the world including U.S. Special Forces assigned to Berlin during the early Cold War.

Introduced in 1929, the Walther PP is an iconic weapon of the Second World War serving with the Nazi military and police. Its most popular version, the Walther PPK, cemented itself in history by being the pistol Adolf Hitler used to take his own life. However, the Walther pistol would outlive the third reich. On the silver screen, James Bond would use the PPK as his pistol of choice. Additionally, the Soviet Makarov pistol would take heavy inspiration from the PPK's design. Because of the pistol's enduring legacy, it continues to see production to this day.

The Tula Tokarev Pistol was developed in 1930 to meet a need by the Soviet Revolutionary Military Council to replace their 19th century Nagant revolvers. Based on John Browning's designs, the Tokarev deployed with Soviet officers in World War II being built in excess of 1 million units. Despite its success, it would never completely replace the Nagant revolver. After the war, many Soviet-aligned countries would receive the TT-33 or produce domestic copies such as with Pakistan and China.

Designated the “Flare Projector 45” to hide its true purpose, the FP-45 was deployed in excess of 1 million units to resistance fighters from France to China. Entering service in 1942, the FP-45 was the brainchild of a Polish military advisor who envisioned it as a tool for resistance fighters to kill an Axis soldier and get their hands on a real weapon. Gaining traction, the U.S. Psychological Warfare Committee contracted General Motors to begin mass production, and while U.S. soldiers never were issued the weapon, the gun was smuggled and paradropped deep behind enemy lines where, due to the nature of the weapon, records of its effectiveness were lost to time.

Designed by John C. Garand in 1928, the M1 Garand holds an iconic status as one of the most influential and widely recognizable rifles in history. Officially adopted by the U.S. military in 1936, the M1 Garand was designed to phase out the bolt action M1903 rifle as the standard U.S. service rifle. The Army was first to mass adopt the M1 Garand as it provided the troops with superior semi-auto firepower. The U.S. Marines followed in the Army's footsteps later due to concerns with reliability issues in the gas-operated loader. Seeing combat during World War II and the Korean War, the M1 Garand was produced in the millions and had its design contracted out to manufacturers like Winchester, Beretta, and others. Only until the development of a select-fire battle rifle, like the M14 in 1958, was the Garand replaced.

During World War II, the U.S. military found that rifles like the M1 Garand were too oversized for support troops, while pistols like the M1911 were too underpowered to protect the soldiers if they were forced into combat. In 1942, the M1 Carbine would be rolled out to medics, reservists, artillery men, and other rear echelon troops. While being criticized as underpowered, the 30 Carbine round had as much punch at 300 yards as the 357 magnum does in the same barrel. In addition, the carbine was less than half as heavy as the M1 Garand and M1 Thompson. Ultimately, the M1 Carbine would be produced in higher numbers than even the legendary Garand and would go on to see combat with the U.S. military until as late as the 1970s. In the 21st century, the M1 Carbine still serves with countries around the world. Furthermore, its light build made it an ideal weapon of the first generation of SWAT teams.

Nicknamed the Jungle Carbine, the shorter Lee-Enfield variant was developed from the lessons learned in the close combat of the Pacific theater. Beginning production in 1944, the rifle would see its heaviest combat in World War II and the Vietnam War with Commonwealth forces. Ultimately being replaced by the L1A1 rifle, the No 5 rifle would be the last major variant of the Lee-Enfield line used by standard forces in the UK and her territories.

Introduced in 1936, the Manufacture d'Armes de Saint-Étienne (MAS) Modèle 36 rifle was adopted by the French army to replace the Great War era Lebel and Berthier rifles. However, it was accepted that the MAS 36 would only serve with reserve forces as semi-auto rifles are developed and introduced. However, the outbreak of World War II and the occupation of France by the Nazis put those plans on hold. While only seeing limited use during the Battle of France, it saw more production and combat with the French Army and French Foreign legion during conflicts like the Suez Crisis and Algerian War. While production ended in 1952, the MAS-36 continues to see use by small countries and irregular groups to this day.

Entering service in 1935, the Karabiner 98 Kurz or Carbine 98 would serve as the primary rifle of the Nazi Wehrmacht during the Second World War. The carbine designation was intentionally misleading as, while the rifle was shorter than its predecessor (the Gewehr 98), it was only designated as a carbine to comply with the Treaty of Versailles for mass production. The K98 would see action on all fronts Germany fought in and with all branches of the German military, being well regarded as a reliable and highly accurate rifle. After the war, the rifle would see limited adoption by counties formerly occupied by the Nazis, however more modern designs would make the bolt action rifle quickly obsolete.

The Gewehr 43 was developed in 1943 by the Germans to equip their forces with a semi-automatic rifle. Initial development led to the relatively underwhelming Gewehr 41, however, after capturing semi-automatic SVT-40s during the invasion of the Soviet Union, the design was updated and accepted as the Gewehr 43 or Karabiner 43. During the war, the Germans produced nearly a half million units, just short of becoming standard issue, but seeing extensive combat regardless. After the war, the rifle continued to serve with the Czech, East German, French Indochina, and Ireland before swiftly being superseded by more modern designs.

Also known as the MP 44, the StG 44 was put into service in 1943 by the Nazis to counter new Soviet submachine guns like the PPSH-41. Using a novel intermediate cartridge, the StG 44 offered the average infantryman similar firepower to a machine gun at the cost of some range while still outranging older machine pistols. While unable to save the Third Reich, the design would become the inspiration for the Soviet AK-47 and a pioneer for the concept of an intermediate cartridge rifle. After the war, the StG 44 would continue to see service with the East German military and be sold internationally seeing limited use by countries like Ukraine, Syria, and Czechoslovakia.

An upgrade of the earlier, more unreliable SVT-38 and AVS-36 of the Finnish Winter War, the Tokarev Self-loading Rifle Model 1940 was originally planned on being the new Soviet standard service rifle, however, with the surprise Nazi invasion in 1941, the Soviets were forced to press the Mosin-Nagant back into service. Despite this, the SVT-40 was built in excess of 1.6 million units and saw extensive combat. After the war, newer more refined designs like the SKS and AK-47 would quickly make the SVT obsolete, however many continued to see service in countries like Korea, Vietnam, and Finland.

The M1D Garand, introduced during World War II, is a specialized variant of the iconic M1 Garand rifle, designed to serve as a designated marksman rifle. An improved version of the M1C marksman Garand, the M1D only saw limited use in World War II. However, after the outbreak of the Korean War, the design was put back into production. Ultimately, it wouldn't be until the Vietnam War before the U.S. Marine Corps would replace the M1D with more modern bolt actions as their standard sniper rifle.

Known as The Rifleman's Rifle, the Model 70 is held in high regard by sport shooters and veterans. Introduced in 1936, the Model 70 built on the earlier Model 54, which itself took design elements from the Gewehr 98. The rifle quickly saw widespread success with the American civilian market as it was a light, reliable, and accurate bolt action. During World War II, while the U.S. Marine Corps officially only adopted the M1903 Springfield and M1 Garand, the Model 70 would actually see a fair amount of combat. Even as late as the Vietnam War, the rifle was still being used by U.S. forces in lieu of more modern or official alternatives.

Shotguns

- This weapon has a Smoothbore barrel and Scopes will not affect the accuracy of the gun
- Buckshot is Scattering ammo and ignores size penalty To-Hit small objects

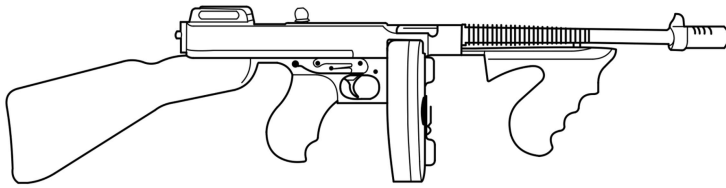

Based on the less popular Remington Model 17, the Ithaca would refine and simplify the design into a reliable powerhouse. While initially struggling to make sales during the Great Depression, the M37 would go on to see wide use during World War II, the Korean War, and the Vietnam War as well by civilians and law enforcement. Designed to compete with the widely popular Winchester M1912, the Ithaca was produced in the millions and is the only pre-Second World War shotgun continuing to see production to this day.

In 1941, the need for a cheaper and easily mass produced submachine was identified by the U.S. Ordnance Board after reviewing German MP 40s and British Sten guns. Departing from the pre-war submachine gun philosophy of highly complex precision machines like the M1 Thompson, the Greaser, nicknamed for its resemblance to the grease gun garage tool, was selected to be produced by the Inland division of General Motors out of stamped sheets with a simple blowback open bolt design. While intended to be phased out by M14 and M16 select fire rifles, the Grease Gun saw service with the U.S. forces as late as the Gulf War as reserve weapons for tank crews. To this day, captured, replica, and modernized M3s see combat around the world.

The M1928A1 Thompson, colloquially known as the "Tommy Gun" or "Chicago Typewriter" is an iconic American submachine gun. Originally developed under the name "Annailater" by John T. Thompson to trench sweep during the Great War, the M1928 wasn't built in time and instead became synonymous with the gangster era of the 1920s and 1930s due to its appearances in various movies and criminal activities. During the Second World War, the Thompson was adopted as the M1928 and would be used by U.S. and British forces, seeing action in nearly every theater.

An evolution of the M1928, Savage Arms made the M1A1 in 1941 to simplify the design to fit wartime production needs. The M1 Thompson would go on to become the more popular model of the Second World War and see combat in subsequent conflicts by a variety of nations. Seen as more practical than its predecessor due to its low cost, weight, and more reliable box magazine, the M1A1 would be used in a variety of roles as a portable source of high volumes of fire. It wasn't until the even cheaper and simpler M3 Grease gun started deploying in mass did the Thompson start to get phased out. However, even by the war's end, the Thompson had still been produced in higher numbers than the M3.

In 1941, during the Battle of Britain, the UK could not meet wartime demands for submachine guns by only importing the American Thompson. Developed from an emergency need for a cheap and simple automatic weapon, the Sten gun would go on to become the second most produced submachine gun of the war behind the PPSH-41 with up to 4.6 million Sten units being fabricated. Sten guns were used by the British Commonwealth in nearly every theater and distributed to rebel forces in Axis-occupied countries. After the war, the Sten would see combat in the Korean War and was exported around the world for use in conflicts like the Vietnam War by U.S. Special Forces and by both Chinese nationalist and communist forces during the Chinese Civil War.

Developed in 1938 within the garage of the Australian Evelyn Owen, the Owen gun was initially rejected in favor of the Sten gun, however subsequent testing revitalized production in 1942. During World War II, New Zealanders fighting in the Pacific theater found the Owen preferable compared to the Thompson submachine gun. Australia also adopted the Owen and continued to use it in Korea and Vietnam before it was replaced by the M16 rifle.

Developed for the Royal Italian Army in 1938, the MAB 38 was a high quality submachine gun deriving its design from the Great War era Villar Perosa aircraft submachine gun. While Italian production capabilities were limited, the gun saw extensive use by special forces and military police throughout the Second World War. Unlike other wartime submachine guns which prioritized rugged simple construction, the Beretta came from a pre-war high complexity design ethos that guns like the Thompson also derived from. However, despite the demanding quality requirements, the weapon was produced in excess of 1 million units and was highly desirable during and after the war for its quality craftsmanship.

Simply referred to as the Schmeisser by Allied forces, the Maschinenpistole 40 was an upgrade and simplification of the more complex MP 38 and 36 to better meet Nazi wartime production demands during the 1940s. The Germans quickly ramped up production as their bolt action armed soldiers struggled against the firepower of Soviet troops armed primarily with automatic guns like the PPSH-41. After the war, the MP 40 would be phased out for more modern submachine gun designs as well as distancing post war Germany from Nazi imagery. Despite this, irregular forces, particularly in the Middle East, continue to use the weapons to this day in increasingly limited numbers.

The PPSH-41, introduced in 1941 during World War II, is a Soviet submachine gun renowned for its high rate of fire and robust performance. Often called “papasha” meaning “daddy” or “burp gun” for its high rate of fire, the PPSH-41 was a widely used and iconic weapon of Soviet forces on the eastern front. Developed as a simplification of the older PPD-40, the PPSH-41 was a response to the cheap and effective Finnish Suomi KP/-31 used against the Soviets in the Winter War. With over 5 million units produced by the end of the war, the submachine gun was mass exported to Soviet-aligned countries and continues to see combat to this day.

Developed by the Soviet Union in 1943 as a simpler lower rate of fire replacement to the PPSH-41, the Red Army during the Great Patriotic War had a unique doctrine of equipping entire squads, platoons, and sometimes battalions with submachine guns. With the PPS being made mostly of stamped sheet metal, the Soviets benefited from reduced production cost and complexity. The PPS would go on to be produced in the millions and continued to see service until the 1960s with the Soviets and, even to this day, with other forces. It wasn't until the proliferation of the AK-47, which itself was developed as a submachine gun, was the PPS-43 considered obsolete.

At the outset of war in Europe, the U.S. Army quickly pushed the BAR into the role of a general purpose or light machine gun by 1938. The select fire switch was replaced with two modes of automatic fire with different RPM. While initial doctrine called for one BAR per squad, the inherent lack of ammo and sustained fire capabilities meant that as the war matured, more BARs were issued per squad and tactics shifted from using the weapon as an emplaced machine gun back to the originally intended automatic rifle. After the Second World War, many BARs were exported and continued to see service in the U.S. Army in Korea and by backline forces in Vietnam before ultimately being replaced by battle rifles and more advanced general purpose machine guns.

Born from a need to replace the Vickers and Lewis machine guns, the Bren gun entered service in 1938. Its design can be traced back to the Czechoslovak ZB vs. 26, but adapted to be compatible with Commonwealth armies. First deployed into combat during World War II, the gun gained respect as a reliable and more mobile alternative to the Lewis light machine gun. The Bren would go on to be used in every theater the United Kingdom and her allies fought in. After the war, the Bren was exported or captured by nations across the world. While the UK eventually replaced the Bren in the 1990s with the SA-80 and FN MAG platforms, other countries and paramilitary groups continue to use the Bren to this day.

In 1941, the Luftwaffe ordered a new select-fire rifle for their paratroopers to replace the submachine guns and standard rifles as German Fallschirmjäger units were finding themselves outgunned by entrenched allied forces. Despite the 7.92×33mm Kurz intermediate cartridge existing, the air force demanded the new FG-42 be chambered in full rifle caliber. The gun would first see use in a raid by Waffen-SS commandos to jailbreak Mussolini who had been ousted by the Grand Council of Fascism and King Victor Emmanuel III. While never deployed in enough numbers to equip most paratroopers, the FG-42's design went on to be studied by the Americans and may have influenced the design of the M60 machine gun.

The DP-28, introduced in 1928 and prominently used during World War II, is a Soviet light machine gun distinguished by its distinctive top-mounted pan magazine. Its design facilitated efficient reloading and sustained fire, earning it the nickname the Russian Record Player due to its rotating action. Although the DP-28 was relatively heavy, its durability and simplicity contributed to its popularity among Soviet troops on the Eastern Front. It provided suppressive fire and essential support for infantry units. Despite its eventual replacement by the more compact RPD and other firearms in the Soviet Union, reserve and irregular forces like the Taliban and Vietcong would still use the gun.

The successor of the M1917 heavy water cooled machine gun, the M1919 was designed to be less awkward to carry during patrols or offensive actions. Entering service just after the First World War in 1919, the M1919 would be implemented in armored vehicles, aircraft, and infantry platoons. The gun would see heavy action in the Second World War with the U.S., Soviets (under lend lease), and many other Allied countries. After the war, the M1919 would be largely replaced by more advanced general purpose machine guns like the M60, however it remains in service with many countries to this day having seen combat in countries like Vietnam, Rhodesia, Iraq, Mexico, and many more.

Developed as the first Einheitsmaschinengewehr or general machine gun, the MG 34 was procured to replace light, heavy, and vehicle specific machine gun designs. Properly adopted in 1939, the MG 34 would go on to become the primary machine gun of the Nazi war machine until the adoption of the MG 42 which was far simpler to produce with a significantly higher rate of fire. Despite this, the MG 34 would continue to serve, particularly in vehicles where the MG 42's barrel was swapped from the side making it incompatible with tank hulls. While there was some continued use of the design by the Czechs, Norwegians, and North Koreans, ultimately the MG 34's would cease production after the conclusion of the Second World War

Nicknamed Hitler's Buzzsaw for its high rate of fire, the MG 42 is an iconic piece of Nazi technology. Born from a 1937 study to produce a cheaper and simpler alternative to the first generation MG 34 Einheit Maschinengewehr, the Großfuß (or Grossfuss) design made by Dr. Gruner was selected. By 1943, the MG 42 had surpassed the MG 34 production numbers, becoming highly popular with the Wehrmacht and Waffen-SS while becoming infamous with Allied forces. After the war, the MG 42 would be rechambered and re-adopted as the MG 1 (later MG 3) by the new Bundeswehr. Despite ties with Germany's Nazi past, the weapon proved too useful and still hasn't been fully phased out to this day, seeing combat during the Troubles, the Iraq War, and the war in Ukraine.

Nicknamed the Ma Deuce, a mispronunciation of “Mod Deuce” or Model 2, this classic heavy machine gun is often simply referred to as The Fifty-Cal. Developed from the watercooled M1921 50 cal machine gun, Colt would continue development of the gun after John Browning’s passing in 1926. Entering service in 1933, the powerful and rugged design would be employed in the infantry support, tank, anti-aircraft, boat, sniper, helicopter, airplane, APC, and many other roles. The gun would also be adopted around the world with no current plans for replacement. Currently, the M2HB or Heavy Barrel variant is manufactured by Ohio Ordnance, FN Herstal, and General Dynamics.

Known as the Dushka or “beloved” in English, the DShK entered service in the Soviet Union as a multi-purpose heavy machine gun. It could be used as an anti-aircraft gun, a vehicle mounted gun, or in an infantry support role fitted on a wheeled mount. The DShK thrived in the export market with countries like China, Vietnam, Iraq, and many more. While there have been attempts to replace the platform, the DShK is still in service with many countries, paramilitary groups, and even Russia itself.

Note: - Follow Direct Fire Artillery rules or Indirect with d10 Spread Die - Explosion damage is equal to 2 × Offensive Grenade damage - Anyone within Close Range and a 90° cone opposite the direction of fire (aligned with a Cardinal Direction) takes 3d6 shock damage from the backblast - Can react to this as if it were a grenade - This weapon has a default Tube Magazine, +3 To-Hit when Prone		

The Bazooka, named after the Bazooka brass instrument, which itself was named after the expression “Bazoo” being slang for the mouth. Also known as the Stovepipe, the Bazooka was introduced in 1942 and saw extensive use during the Second World War by U.S. troops and continued to see combat into the Korean War. While not nearly as prolific as Soviet RPGs, advanced versions of the Bazooka would continue to see use by numerous factions in many conflicts up to modern day.

Brandt M2 Mortar

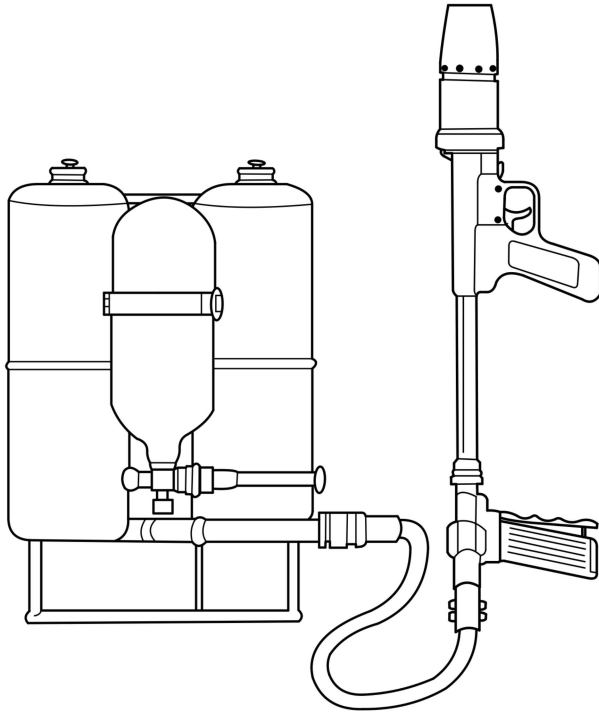

Note:

- Follow Indirect Fire Artillery rules with d8 Spread Die
- Explosion damage is equal to Fragmentation Grenade damage
- Due to the high angle of the mortar, the Shell lands 1 Round after firing (roll To-Hit when it lands and before completing your normal action)

Weapon Type	Infantry Mortar
Damage Single Shot	Fragmentation Grenade
Ammo	M6 Shaped Charge AP Rank 4
Magazine Size Tube Magazine	1 Grenade 1 Projectile per 0.5 EqS
Equipment Slots	17
Max Range	400 Squares

Licensed from the French company Brandt as an alternative to the heavier M1 mortar in 1940, the 60mm M2 mortar would provide infantry with a portable and fast acting artillery supplement at the company level. This earned it the nickname “Commander’s pocket artillery” for its effectiveness at portable heavy fire. Used by U.S. troops in the Second World War, the M2 mortar would go on to be used again in Korea, Vietnam, and a variety of other conflicts by multiple nations.

US Army M2 Flamethrower

Note:

- Must ignite charge before firing. Charge ignites instantly and lasts until the end of the next Round or until firing ends
- Target a Space within Short Range, then draw a straight line from you to the center of the targeted Space. Any Spaces the line passes through take full Burst damage with Extra Attacks
- All adjacent Spaces to the targeted Space deal 1d6 damage regardless of Extra Attacks
- Damage ignores Cover and Concealment
- Hit targets are set on fire, which follows bleed rules

Weapon Type	Flamethrower
Damage Burst (1 Quart)	2d6 Burned Skin or Flesh Corrosion
Extra Attack (Burst) No To-Hit roll required	Up to 3 Extra Attacks 1 Quart per extra attack (1d6)
Ammo	Gasoline
Magazine Size Tube/Belt Box	5 Charges/16 Quarts Spend 1 Action to load 5 Charges Follow Belt rules to refill Gasoline
Equipment Slots	14
Heft Score	2
Max Range	6 Spaces

Developed by the U.S. Army Chemical Corps, the M2 first saw combat in the Pacific during World War II with the U.S. Marines. The flamethrower was a horrifically devastating tool used to clear bunkers, tunnels, and other well defended positions. Flamethrowers would go on to be used as late as Vietnam before ultimately being withdrawn due to concerns about their combat effectiveness being replaced by the Northrop M202 FLASH incendiary rocket launcher in 1978.
