Part 7 Advanced Combat

Throwing & Grenades

Throwing an object can cover lobbing a grenade to hurling a knife. The distance of a throw is determined by the thrown object's EqS.

Light ≤ 1.5 EqS

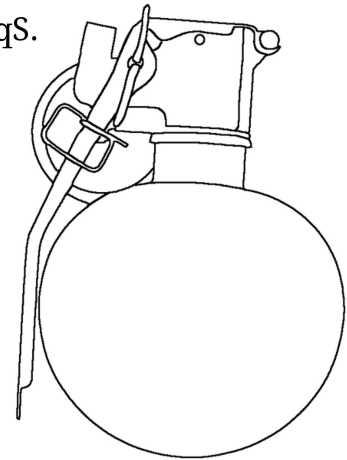

- Grenade sized objects
- Throw distance: Short (6 Spaces)

Medium ≤ 10 EqS

- Rifle sized objects
- Throw distance: Close (3 Spaces)

Heavy > 10 Eqs

- Machine gun sized objects
- Throw distance: Point Blank (1 Space)

The throw distance means you can target any Space at the labeled distance or below. You can throw a distance category higher if you succeed a DC 15 1d20 + Power Check. If failed, the object lands the furthest it can towards the target.

If the throw is more complicated, such as bouncing off a wall or making it into a window, a 1d20 + Reflex Check will also be required. The GM will determine the DC, with a DC 10 representing a reasonably challenging throw. If you throw to directly hit a person, like with a throwing dagger, you roll a 1d20 + Focus Check applying your target's Stance & Visibility modifiers to beat a DC of 10 similar to a To-Hit Check. The damage of a thrown weapon is equal to its Strike Attack. If none is listed, it is determined by the GM. Typically most Light objects will have a damage of 1d4 + Power.

When a grenade lands close enough to damage you, you can respond with a Reflex Check. How high you roll gives you options to respond listed below and determines the order in which people respond from highest to lowest.

- Take cover (DC 10): Move 1 Space away from the center of the explosion.
- Sacrifice (DC 5): Move to the center damage Space of the grenade, blocking all damage to anyone else.
- Shove (DC 5): Shove an ally 1 Space if they are within Point Blank of you and within the blast radius. If you have been shoved, you cannot shove another player.

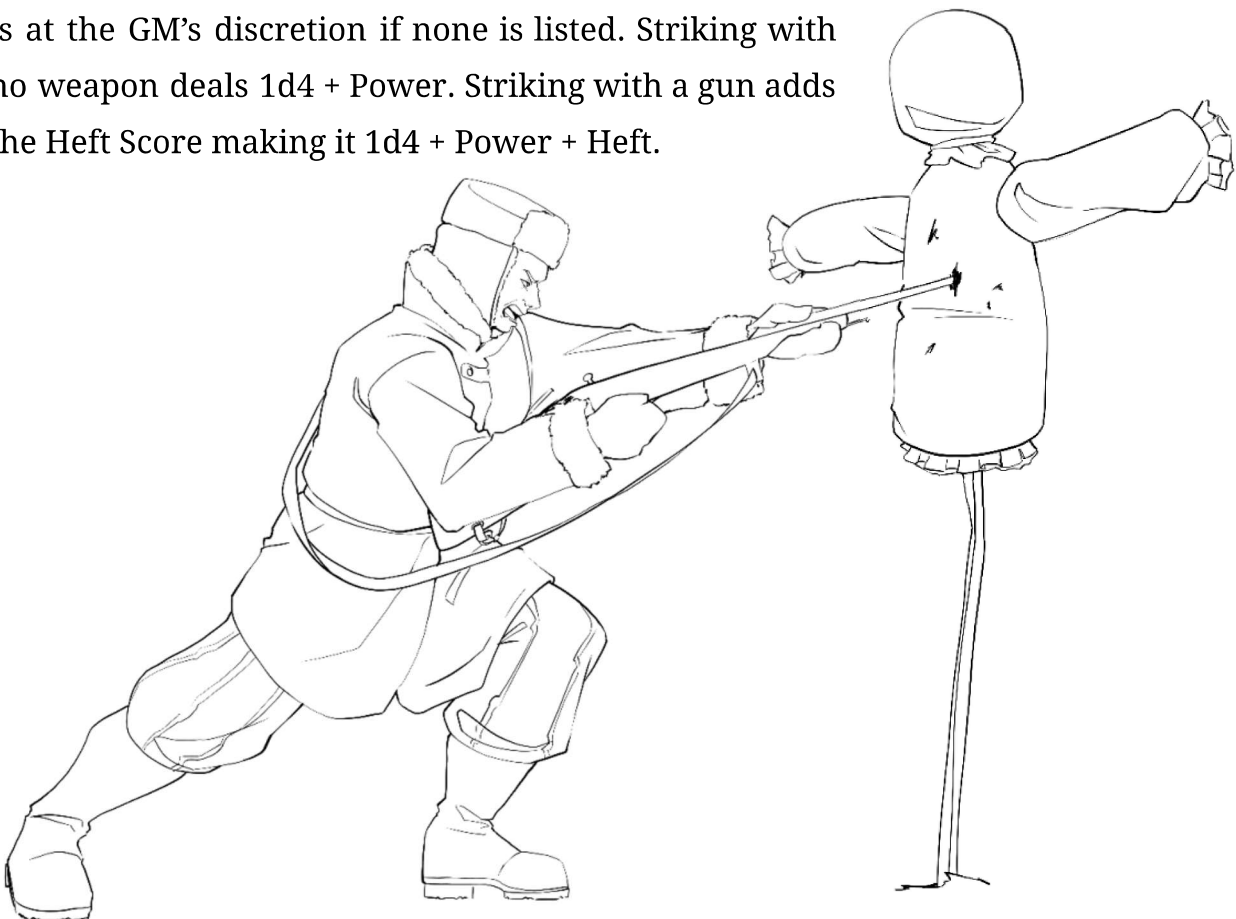

Melee Combat

Melee combat is split into two types: Striking and Grappling. Both must be done within Point Blank range and both have an Armor Penetration of 0 unless otherwise specified. If you shoot a gun at Point Blank against someone who has made or attempted to make a Strike or Grapple against you since your last Turn, the attack will only hit if you deal double damage by rolling 20 or higher To-Hit.

Strike Attack

A Strike Attack is similar to a swing of a sword or stab of a knife. Striking is a contest between the attacker's $1d20 + \text{Power}$ and the defender's $1d20 + \text{Reflex}$. Some weapons can parry which allows the defender to roll their Strike attack (normally $1d20 + \text{Power}$) instead of $1d20 + \text{Reflex}$. Additionally, being Prone or otherwise disadvantaged gives your opponent Advantage on the contest.

If the attacker wins the contest, they may roll their weapon's damage or shove the target 1 Space. Striking damage is dependent on the melee weapon, and is at the GM's discretion if none is listed. Striking with no weapon deals $1d4 + \text{Power}$. Striking with a gun adds the Heft Score making it $1d4 + \text{Power} + \text{Heft}$.

Grapple Attack

Grappling the enemy is a brutal and risky struggle, but may prove necessary to accomplish or survive the mission.

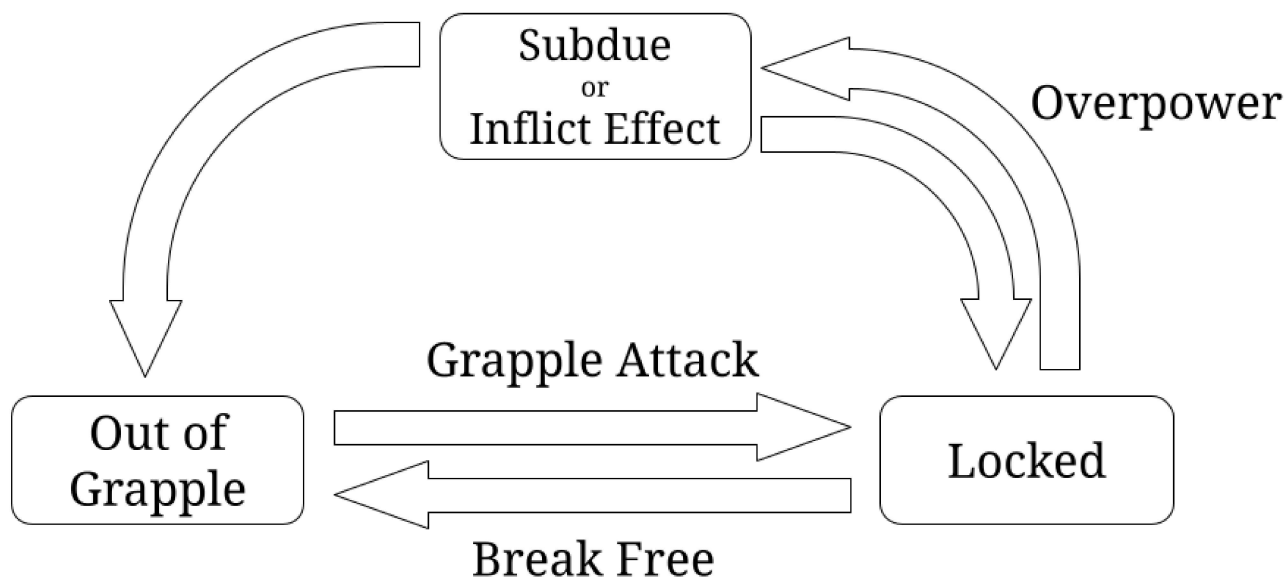

Initiating a Grapple Attack is a contest between:

- The attacker's 1d20 + Power.
- The defender's 1d20 + Power or Reflex, whichever they choose.

Upon a successful initial Attack, the players are Locked into a Grapple as shown in the chart below. If the attack fails, then the Grapple does not start and the attacker's Action is used.

Once Locked in a Grapple, this Action does not end until one party breaks free, is subdued, or is killed. Additionally, all Two-Handed weapons are dropped. It should be noted that these weapons can be picked up instantly following the drawing rules if Grapple ends and the weapons or players have not moved.

Once Locked in a Grapple, the attacker must attempt to either:

- Overpower (1d20 + Power against 1d20 + Power).
- Break Free (1d20 + Power or Reflex against 1d20 + Power).

If successful in Overpowering, the attacker can choose to inflict one of the following effects. After which the Grapple moves back to Locked, unless the Action is ended, where the attacker can again choose to Overpower or Break Free:

- Deal Grapple damage, if no Grapple damage is listed or you are unarmed, the damage is 1d4 + Power.
- Shoot a One-Handed gun, usually a Pistol or Revolver. Recall that the To-Hit roll must be 20 or higher, dealing double damage or missing.
- Make the defender a human shield following shield rules with AR 2.
- Subdue the defender, ending the Grapple Action.

Subduing represents constraining the defender, halting the momentum of the immediate Grapple Action and making the defender more vulnerable.

- When subdued, if the defender wishes to resist on their Turn, their entire Turn is spent starting a Grapple Action, where they must win a Grapple contest to get back to Locked before attempting their own Overpower.
- After subduing, the attacker can make Movement Actions on their Turn, moving the target with them at the Creep speed of 3 Spaces per Action.
- The target will be unable to resist items being taken off of them or restraints being placed on them.

If the attacker fails their Overpower contest, the Grapple moves back to Locked and the defender becomes the attacker and may now roll to Overpower or Break Free until they subdue, escape, or fail a contest themselves.

If there are multiple parties within Point Blank of either the attacker or defender in the Grapple, they can offer help by adding their Power, minimum of 1, to their ally's Grapple contest rolls.

Stealth & Sneak Attacks

Attempting to not be noticed is a contest, roll a 1d20 + Reflex Check against your enemies' 1d20 + Focus Check. Depending on the levels of alertness and other situational context factors, the GM may add advantages or disadvantages to the rolls. If you are stealthing against a group of enemies, you should only beat the roll of the enemy with the highest Focus modifier. If you are attempting to Stealth while moving, you must move at the Creep speed of 3 Spaces per Action.

Stealth is not the same as “concealment” as when you are stealthing your foes are totally unaware of you. Refer to Stances & Visibility for concealment rules.

Sneak Attacks are special attacks that only apply when you are hidden to the target or when the target is not paying attention to you, such as if they are fleeing or if you are betraying them. If you Strike as a sneak attack, it will hit automatically and deal double damage. If you initiate a Grapple as a Sneak Attack, you automatically succeed at “Locking” into the Grapple. Additionally, at the GM’s discretion, any attack, particularly with a firearm, can be ruled as an instant kill, requiring no dice roll.

Damage Types

Ballistic

Most damage from firearms and other ranged weapons is considered Ballistic which has no special effects. If unspecified, the damage type is Ballistic.

Edged

Edged weapons are any weapon that is used to hack, stab, or slash. These weapons usually add Power to damage and tend to deal more base damage than their Blunt counterparts. Negative Power affects damage when added, however the total damage will be a minimum of 1. Masks protect against Edged attacks.

Blunt

Blunt weapons are used to bash, crush, and pummel. Damage from a Blunt weapon usually multiplies with Power, making it more viable with stronger users. When multiplied, a Power score of 1 or below counts as a ×1 multiplier. Helmets protect against Blunt attacks.

Shrapnel

Shrapnel damage is an explosion that launches a shower of tiny projectiles. Shrapnel is represented by d4 dice and can be fully blocked if there is terrain in the way. Additionally, with armor, you must roll Coverage for each d4 damage dice. Overlapping explosions will stack damage dice but not Armor Penetration.

Shock

Shock damage is an explosion that emits a deadly pressure wave. Shock is represented by d6 dice and ignores terrain and armor dealing damage straight to the target. Overlapping explosions will stack damage dice.

Chemical

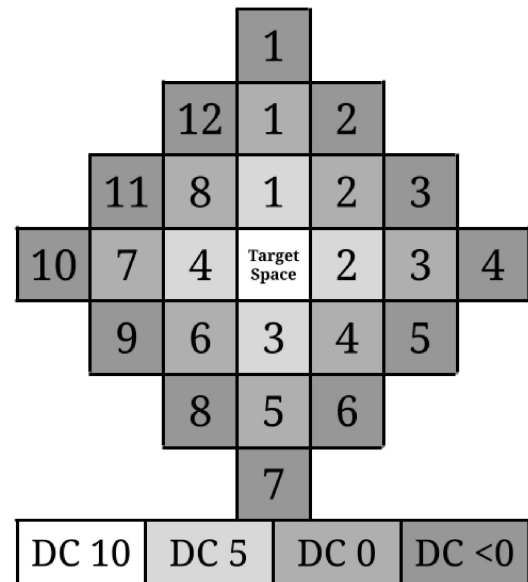

Chemical damage covers a wide variety of hazards like fire, noxious gas, radiation, and electricity, where the specific effects are at the GM's discretion.

Direct Fire Artillery

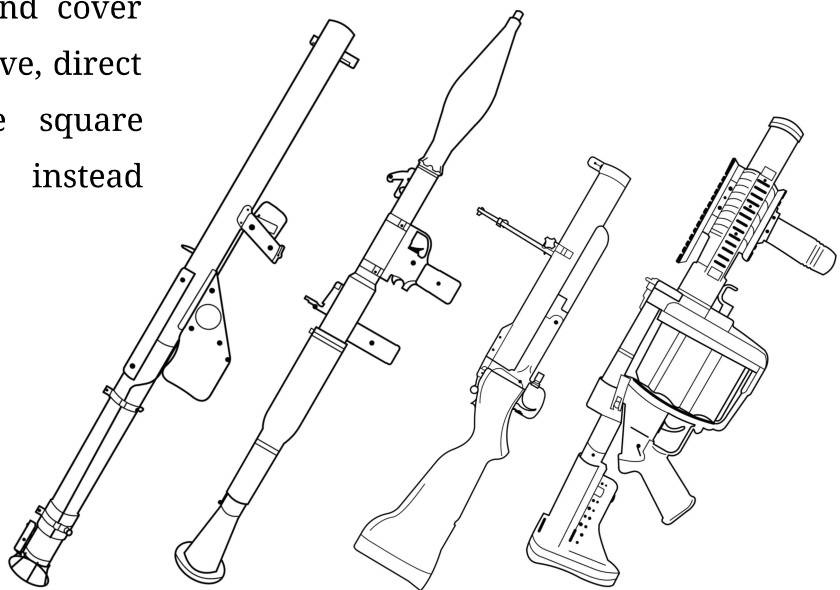

Direct artillery rules apply to any subsonic (usually hand-held) munition such as a bazooka, grenade launcher, or RPG.

Where your shot lands is determined by a normal To-Hit roll, except, instead of beating the target's To-Hit Check of 10, you need to beat a predetermined DC.

- DC 10 and above hits the targeted square.
- DC 5-9 hits one of the four squares adjacent to the targeted square as shown in light gray. Roll **1d4** to determine where it lands.
- DC 0-4 hits further away from the targeted square as shown by the gray squares. Roll **1d8** to determine where it lands.
- Below DC 0 hits even further away from the targeted square as shown by the dark gray squares. Roll **1d12** to determine where it lands.

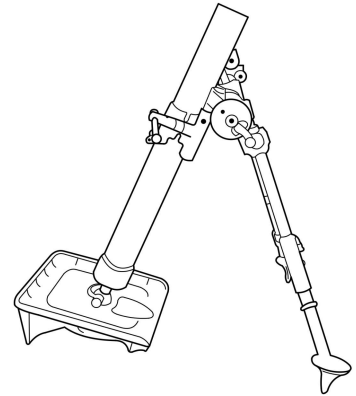

If the target is behind cover from the shooter's perspective, direct fire cannot land in the square protected by the cover, instead hitting the square in front.

Indirect Fire Artillery

Indirect artillery fire represents grenade launchers or mortars fired from more than 45 degrees upwards. The user forfeits the ability to single out targets and instead fires into an area, raining munitions from above, ignoring cover and concealment.

Target a Space within your weapon's indirect fire range. Roll the weapon's Spread Die twice to determine where the munition lands. The middle and highest value of the Spread Die are on the targeted square while any deviation lands farther from the center both vertically and/or horizontally. The figure below provides an example for a d10 Spread Die. Note how the middle value (5) and highest value (10) correspond to the center of the grid.

Special Targets

When shooting at inanimate targets, follow the standard To-Hit rules. However, the GM may consider Size and Speed modifiers when attacking non-standard targets.

For Size —

As a general guide, a standard human crouching has a size modifier of +0. An object half that size will apply a -2 To-Hit whereas doubling the size will apply +2 To-Hit. Using this rough system, the GM may follow these examples:

- Targeting smaller objects such as a grenade could be a -10 To-Hit, pigeon sized objects might be -8, a raccoon or briefcase may be -6, a car tire -4, and a window -2.
- For larger objects, the system applies in reverse. A car engine or standing person could be +2, a horse or car +4, a tank or helicopter +6, a cargo plane or bunker +8, and truly gargantuan objects could be +10 or more.

For Speed —

If you are moving at a speed relative to a target, you both apply a relative To-Hit penalty on each other. The specific penalty is at the GM's discretion but below are some recommended examples:

- Starting at -2 To-Hit for anything moving at a running pace, -4 could be for horses and bicycles, -6 for tanks and steam trains moving at top speed, -8 might be for trucks and jet skis, -10 for cars and motorcycles, and -12 or more for helicopters or airplanes.

Keep in mind that Size and Speed modifiers may cancel each other out.
