The Colt Commander, introduced in 1950, is a compact variant of the iconic Colt M1911 pistol. Designed as a response to demands for a more easily concealable version of the M1911, the Commander features a shorter barrel and, while some versions maintained the M1911's renowned 45 ACP caliber, the original Colt Commander was the first Colt pistol chambered in 9mm. The Commander's reduced size and weight made it a popular choice for concealed carry and law enforcement use.

Developed as an ideal sport revolver in 1955, Colt engineer De John combined mostly off-the-shelf components and strengthened them to work with the powerful 357 Magnum caliber. Described as the “Rolls-Royce of Colt revolvers,” this premium firearm not only saw success in competitive shooting, but has also seen service with law enforcement, being lauded for its accuracy and smooth action. While discontinued in 2005, a second generation of Colt Python was revived in 2020.

The Smith & Wesson Model 19, introduced in 1955, is a classic revolver renowned for its craftsmanship and performance. Developed by Smith & Wesson, the Model 19 found favor with law enforcement agencies, notably winning contracts in the 1960s, and demonstrated its reliability and accuracy in various law enforcement duties. The Model 19's design showcased S&W's commitment to quality, with its ergonomic grip and adjustable sights, making it a versatile and reliable companion for officers. It became a staple in police arsenals and remains a beloved choice among collectors and enthusiasts to this day.

Debuting in 1955, the Smith & Wesson Model 29 stands as an iconic revolver capturing attention for its power and design. While it initially found popularity among civilians and sports shooters, it gained cinematic fame as the "Dirty Harry" handgun in 1971, further boosting its renown. With its large-caliber punch and robust construction, the Model 29 embodied American handgun heritage, leaving an indelible mark on both pop culture and firearms history.

The Makarov Pistol, developed in the Soviet Union and adopted by Soviet forces as a standard sidearm in 1951, was designed to replace the aging TT-33 pistol and M1895 revolver. Its compact size, robust construction, and straightforward design made it a practical choice for military and police use, as well as for concealed carry. The Makarov PM's legacy extended beyond the Iron Curtain, with numerous countries such as China and Vietnam adopting it or producing their own variants.

The M16A1 was the finalized production model of the M16 built in 1967 for the jungles of Vietnam. Born from Eugene Stoner's AR-15 platform, the M16 encountered early challenges related to maintenance and reliability. Once the teething issues subsided, the M16 gained recognition for its lightweight and controllable recoil compared to battle rifles of the time, ultimately replacing the M14. The M16A1 marked a shift towards smaller caliber, high-velocity rifles in modern warfare, laying the foundation for subsequent generations of the M16 family and other intermediate rifles. Its enduring influence, service in various conflicts, and evolution into a versatile platform make the M16A1 a milestone in the history of military firearms.

Derived from the M1 Garand design, the M14 was developed to modernize infantry firearms and provide a versatile select-fire platform chambered in the more modern 7.62x51mm NATO cartridge. Introduced in 1957 as the standard infantry rifle for U.S. forces during the early years of the Vietnam War, its tenure as the primary infantry rifle was relatively brief, as the M16's emergence led to its phased-out by 1964. Despite its limited active service, the M14's impact persisted through its use by specialized units and as a marksman rifle. Its robust construction, accuracy, and historic significance solidify its role as a transitional design between traditional battle rifles and modern military firearms.

Described as the “Right Arm of the Free World”, the FN FAL was originally developed to fire the Nazi 7.92×33mm Kurz cartridge. After World War II, the British and American governments pressured Fabrique Nationale (FN) to adapt development to meet NATO's desire for a standardized firearm. It was agreed that the British would adopt the American 30 Light Rifle cartridge and the Americans would adopt the FAL as standard issue. Ultimately, the Americans would choose the U.S. designed M14, but the 30 Light Rifle would be adopted as NATO standard 7.62mm. Production began in 1953 and the FAL went on to become widely adopted by over 90 countries and see service in conflicts around the world.

The L1A1 Self-Loading Rifle (SLR), or known in the U.S. as the Inch Pattern FAL, is a British conversion of an FN FAL to imperial units to streamline production for the UK. While NATO standardized the 7.62 bullet, most countries still chose to adopt domestic rifles like the M14 and the G3. The UK and other Commonwealth countries, however, selected the Belgium FAL, but, due to recoil concerns, decided to make their L1A1 and C1A1 rifles semi-automatic only. Entering service in 1954, the L1A1 saw combat in Vietnam, the Falklands, Rhodesia, and more. While mostly replaced by more modern intermediate rifles, the L1A1 is still in service with second line or police forces.

In the twilight years of World War II, the Nazis were working on a new STG 45 assault rifle. After the German defeat, Mauser engineers working on the prototype were brought to France to adapt development of the STG 45 to NATO standards, resulting in the CETME. While West Germany initially adopted the FN FAL as the Gewehr 1 (G1), new interest to replace it led the CETME rifle to outcompete the SIG STGW 57 (G2) and AR-10 (G4) to become the new German standard battle rifle under the name of Gewehr 3. Its modular and flexible design made it a highly successful rifle seeing over 8 million produced from 1958 to the present day and the base for rifles like the MP5, HK33, and others. The G3 has seen combat with such users as the U.S. Navy SEALs, South African Special Forces, Greece, and many more.

Developed by Manufacture d'armes de Saint-Étienne and adopted by the French military in 1951, the MAS-49/56 was the lighter, shorter, and more widely produced MAS-49 variant. The MAS-49 replaced the aging bolt action rifles, gaining praise for its reliability and accuracy. As a result, it wasn't replaced until the introduction of the FAMAS in 1979. The rifle saw service during the First Indochina War and the Algerian War, reflecting its role in colonial conflicts and post-colonial military operations.

Introduced at the tail end of World War II, the M2 Carbine was developed as an upgrade of the M1 Carbine by General Motors to counter the new Nazi STG-44 select-fire rifle. While the M1 Carbine was originally designed to be select-fire, ultimately wartime demands delayed the feature in favor of mass production. This made the M2 design a natural extension of the M1, and while seeing very limited service during the war, it saw extensive use in following conflicts such as the Korean War and even the Vietnam War until its replacement by the M16. After the conflict, the M2 Carbine was exported all over the world finding use on the battlefield as a light, efficient, select-fire package.

The most popular “plinking” rifle in the world with over 7 million being produced, the 10/22 was released in 1964 and continues to be manufactured by Ruger and other copycat companies to this day. The rifle is well renowned for its simple rugged design, being ideal for varmint hunters and new shooters. While military and police use is negligible due to the underpowered nature of 22LR, the IDF has employed a silenced 10/22 variant as a less than lethal riot control weapon.

The CAR-15 was an attempt by Colt to rename the AR-15 to disassociate it from its original ArmaLite branding. While unsuccessful, instead the name CAR-15 and Colt Commando has become associated with XM177 carbine (CAR-15 Model 610). While the Colt Commando rifle wasn't originally in the CAR-15 family, it was changed as the U.S. forces in Vietnam needed a compact M16 but found the CAR-15 SMG variant inadequate. Adopted as the XM177, the rifle saw extensive use by the U.S. Army in the jungles of Vietnam. While it's a myth that the Colt Commando's development led directly to the modern M4 Carbine, the M4 carbine is included within the CAR-15 family.

Often misidentified as the AK-47, the AKM or AK-modernized, is far more widely produced and functionally identical to its AK-47 predecessor. The only notable difference being the receiver was stamped instead of milled for ease of mass production. Introduced in 1949 by the Soviet Union, and producing in excess of 70 million units, this rifle cemented itself in world history seeing use all over the world as a tool of liberation to some and terror to others. It has become such a ubiquitous symbol that it even features on the flag of Mozambique and can be seen in nearly all conflicts around the world.

While the Soviet Union had multiple Semi-Automatic rifles during World War II, it saw the benefits of intermediate cartridges like the German 7.92x33mm. So in 1949, the USSR introduced the SKS rifle as a shorter and lighter standard service rifle to officially replace their aging bolt action Nagants. Unfortunately, this was short-lived as the AK-47 was introduced in the same year featuring select-fire capabilities, rendering the SKS obsolete. Despite this, the SKS was exported to Soviet friendly countries and produced by the Chinese and Eastern Bloc in excess of 15 million, seeing combat on a global scale.

Following World War II, Remington engineers wanted to develop a lightweight and lower cost bolt action rifle that could achieve superior accuracy to legacy bolt action rifles in service at the time. Using precision manufacturing techniques, the Model 700 grabbed the attention of the U.S. military, police forces, and civilian market. Introduced in 1962, the Model 700 is still being produced in the 21st century as an affordable and reliable hunting rifle as well as a lethally effective marksman rifle seeing active service around the world.

While the Soviet Union adopted intermediate cartridges based on German designs following World War II, NATO developed full caliber battle rifles. While less controllable in select-fire, these battle rifles would outrange Soviet intermediate rifles like the SKS and AKM. To counter this, in 1963 the USSR adopted the Snayperskaya Vintovka Dragunova. The SVD would serve as the designated marksman rifle for the Warsaw Pact and Soviet allies seeing combat from the Vietnam War to the modern Ukraine War.

Entering service in 1963, the Stevens Model 77E became the most issued shotgun of the Vietnam War, receiving the title of “riot” gun. While less rugged than the older Ithaca 37, Stevens Arms was the lowest bidder and secured a contract with the U.S. military. The 77E was initially intended to just be used by southern Vietnamese forces, but limited shotgun supply saw it serving extensively with military police or pointmen. The gun proved effective and was exported to numerous U.S. allies or was captured after the U.S. withdrawal from Vietnam.

Later known as the Winchester 1300, the Defender was developed as the successor to the popular Model 1912 shotgun. The Model 1200 would serve in the Vietnam War and, while cheaper and lighter than the Model 12, it was criticized for being less sturdy. Later, the Mossberg 500 would begin to phase out older shotguns like the M1200, however it wasn't until the introduction of the M4 Benelli that the M1200 would be fully replaced allowing it to see limited use during the Iraq War and War in Afghanistan.

Designed in 1944 to replace the Sten submachine gun, the Sterling was only delivered to airborne troops in limited numbers during World War II. After the war, the Sterling would go on to fully replace the Sten gun and serve with the British Army until as late as the 1990s where it was ultimately replaced by the L85 bullpup design. Outside of Commonwealth countries, the Sterling would see use by a wide variety of nations including but not limited to North Korea, India, Egypt, and Iran. Additionally, modified Sterlings were used as props in the original Star Wars film for the Imperial E-11 blaster.

Introduced in 1954 with the Israeli Defense Force, the UZI was named after its inventor Uziel Gal who requested unsuccessfully that the gun not be named after him. Following its deployment and combat successes during the Six-Day War, the UZI became a widely popular submachine gun being produced in excess of 10 million. Despite being developed post war, the design is clearly influenced by wartime mentalities. The gun was primarily made of stamped sheet metal and generally built to be simple and rugged, similar to the Grease Gun and MP-40 developed for cheap mass production during World War II.

Developed in 1949 by the Manufacture Nationale d'Armes de Tulle (MAT) for use by airborne and mechanized French Foreign Legion forces, the MAT-49 is reminiscent of older wartime submachine gun designs with machine stamped components and rugged compactness. The gun saw extensive use in Algeria, Egypt, and Vietnam by French forces. After the French pulled out of Vietnam, the Viet Minh converted many of the guns to fire the Russian 7.62 Tokarev cartridge. While no longer produced, the gun is still in service with some countries and guerilla forces.

A Czechoslovak design, the Skorpion was developed in 1961 for use as a personal sidearm for security and special forces. Exported around the world, the Skorpion saw combat with paramilitary groups such as the Irish National Liberation Army and Italian Red Brigades. Because of its use by irregular groups and criminal organizations, the gun has garnered a reputation of villainy and terror as it packs a lot of firepower into a small concealable package.

Nicknamed “The Pig” and entering service in 1957, the M60 is a staple of American made firepower. However, its origins derive from the German FG-42 paratrooper select-fire rifle. Inspired by the FG 42’s firepower and borrowing some of its design elements, the company US Ordnance won the contract for America’s all purpose machine gun over designs like the FN MAG and rechambered MG-42. The gun went on to serve widely as a crew served and vehicle mounted machine gun seeing service with all branches of the U.S. military. It wasn’t until 1980 that the M249 replaced the M60 at the squad level, however the gun remains in active service around the world.

During the 1950s, the UK and other Commonwealth countries used the L1A1 Self-Loading rifle which was a semi-automatic conversion of the FN FAL. To supplement the rifle's lack of automatic firepower, the L2A1 was introduced alongside the L1A1 in 1954 as a light machine gun to fill a similar role as the Bren or BAR. Some considered the L2A1 inferior to the older Bren light machine gun, and eventually the FN Minimi replaced it in the 1980s, but not before the L2A1 saw extensive combat in Vietnam.

Entering service in 1961, the RPK, sometimes misnamed as the RPK-47, was designed to replace the more complicated RPD as the standard Soviet squad machine gun. While heavier, the RPK handles identically to the AK-47, making it far easier to rapidly train, equip, and maintain troops than with the RPD. Similar to the AKM, it's simple and rugged design makes it an ideal choice for guerrilla forces. Widely adopted by countries within the Soviet sphere, the RPK has seen combat from Vietnam to Ukraine.

Developed in the tail-end of World War II to replace the heavier DP medium machine gun, the RPD entered service in 1948 to become an early progenitor of the squad machine gun concept. Unlike previous machine guns, the RPD was chambered in the new intermediate 7.62x39 cartridge giving it less range but more controllability. Widely popular with the Soviets and their allies, the RPD still sees service to this day fighting in conflicts like the Vietnam War, Yom Kippur War, Gulf War, and the Ukraine War.

Based on the AKM platform, but rechambered to a full rifle cartridge, the PK, aka Kalashnikov's machine gun, entered service with the Soviet Union in 1961 as a battalion level general purpose machine gun. Popular with Soviet sphere countries for its power as a vehicle mounted and standalone platform, the gun was updated in 1969 to the PKM. The PKM offers improved materials and manufacturing techniques and continues to see production up to the modern day.

Originating from a U.S. Army program to develop a special purpose individual weapon, code named project NIBLICK. The M79, nicknamed Bloop Tube and Thumper, entered service in 1961 and was praised for being “the platoon leader’s artillery.” First deployed in the Vietnam War, the M79 has continued to serve with the U.S. and her allies, as well as serving with law enforcement as a riot control device. While largely replaced by the underbarrel M203 and M320 grenade launcher, some special forces still use the grenade launcher due to its increased range.

An iconic piece of Soviet equipment, the RPG-7 entered service in 1961 replacing the older RPG-2. Widely produced in excess of 9 million units, the RPG-7 has become legendary for being a cheap, rugged, reliable, and lethal package. While its main function is as an anti-armor tool, the RPG has also found success against infantry and, in special cases, against helicopters. First deployed in the Six Day War, modern versions of the RPG-7 continue to be used by the Russians and other armies around the world to this day in wars like the Syrian Civil War, Chechian Wars, and in Afghanistan.

Entering service in 1968, the MK 19 can be either vehicle mounted or independently set up to provide heavy supporting fire to infantry platoons. Replacing the older hand cranked Mk 18 grenade launcher, the Mk 19 first saw combat in the Vietnam War and continues to serve to this day. Currently, General Dynamics owns Saco Defense and continues production of more modern variants for the U.S. and her allies.

Nicknamed the “Minigun” for deriving its design from the larger 20mm Vulcan aircraft cannon, the M134 at its core is an electrically driven gatling gun. Because of its power requirements, the minigun can only ever be vehicle mounted, but with that extra power it is able to output a mind bogglingly high volume of fire. First introduced during the Vietnam War as a helicopter door gun, the M134 went on to be incorporated into aircraft like the AC-47 and AC-130 as well as Armored Personnel Carriers and Humvees. The minigun remains in service with many NATO and NATO-aligned countries.
